

# Pathogend™ Protection Process

## Whole Space Decontamination Specifically Tailored to Your Needs

### STEP 1. ASSESSMENT

The most critical stage in our process. It allows us to formulate a custom tailored decontamination plan based on the risks you face and your unique business requirements all designed to avoid excessive time and unnecessary costs. Our assessment includes Swab Testing, Understanding your facilities needs, and setting goals to promote a healthy space.

### STEP 2. BIO-DECONTAMINATION

Choosing from a variety of tools in our disinfection tool box we will determine if all or just one of our proven sterilization or disinfection methods are needed. Some of the equipment in our tool box are Hydrogen Peroxide Vapor, Dry Fogging, Ultraviolet Light, Wet fogging, Electrostatic Spraying or Extended Anti-microbial Protection.

At the very minimum our processes will always include:

- ATP testing- to determine your biological load
- Biological Indicators - to ensure no germs are left alive
- Sporicidal disinfectant wipe down- to remove biofilm
- UV light- for chemically sensitive areas
- Seal off air vents- to allow the fog to fill a space
- Hydrogen peroxide dry mist fogging- to treat 100% of surfaces and air
- Post ATP swab testing- to determine proper germ load decrease

### STEP 3. REPORTS/DOCUMENTATION

Pathogend certified experts combine years of experience in high-level disinfection and unbiased reports generated directly from the CURIS® devices to ensure your organization has the evidence it needs to protect itself from penalizing agencies, concerned customers or staff.

- Detailed decontamination reports with measurable results
  - Location / Rooms / Vehicles
  - Times / Dates
  - Service Techs
  - Outlined Procedure / Process
  - Measurable Results and Pictures
  - Notes / Concerns / Recommendations (if any)

Proven processes ensure your services are second to none
